

Public-good settlement infrastructure for tokenized exposure.

Perpetuals are one of digital assets' largest markets. European financial actors need compliant infrastructure to compete. S&F created Stipflip: a public-good perpetual protocol with no operator, no admin keys, no custodial venue, and no counterparty risk.

CORE DISTINCTION

STIPFLIP

Permissionless public-good perpetual protocol

S&F

Creator and ecosystem company, not protocol operator

MARKET

Fully collateralized synthetic exposure without a trusted venue

THE EUROPEAN OPPORTUNITY

Perpetuals are massive. Europe needs infrastructure it can actually use.

\$86.2T

2025 CEX perp volume

\$6.7T

2025 perp DEX volume

+346%

Perp DEX growth

The perpetuals market is dominated by offshore venues and trusted operators. European brokers, wallets, fintech apps, market makers, and digital asset venues have distribution and clients, but they lack a public settlement layer that removes custody, counterparty, admin-key, and opaque settlement risk.

Stipflip gives European actors a way into this market: fully collateralized synthetic exposure, wallet-held position tokens, transparent collateral, and settlement by public protocol rules.

Market figures: CoinGecko 2025 Annual Crypto Industry Report.

INVESTMENT MEMO

A perpetual protocol without an operator.

THE THESIS

Most perpetual markets introduce a trusted venue: an exchange, clearing engine, admin-controlled protocol, or balance-sheet counterparty. Stipflip removes that role.

No operator

No admin keys

No custodial venue

No balance-sheet counterparty

Fully collateralized exposure

Protocol-level settlement

Zero counterparty risk thesis

Public-good protocol

No admin keys

WHAT S&F DOES

Help European companies build around the public-good protocol.

Stipflip is public infrastructure. S&F is the company that makes it usable for professional actors: consultancy, company onboarding, implementation support, protocol documentation, compliance materials, monitoring, analytics, and operator playbooks.

Venues can build execution, interfaces, routing, liquidity, risk controls, and customer relationships around Stipflip. S&F helps them reach production without building a full perpetual exchange stack from scratch.

B2B onboarding

S&F helps brokers, wallets, fintech apps, market makers, and digital asset venues understand the protocol, choose their role, and launch around Stipflip.

Technical implementation

S&F provides developer tools, API guidance, market setup, oracle integration support, monitoring, dashboards, and implementation assistance for production deployments.

Compliance package

S&F prepares protocol documentation, risk mapping, MiCA/MiFID analysis support, transparency reports, and materials legal teams need to evaluate their service model.

Operator playbooks

S&F designs playbooks for venues, liquidity providers, market makers, oracle participants, and application builders operating around the public protocol.

Ecosystem growth

S&F coordinates builders, reference markets, liquidity experiments, public documentation, and partner support so the public good becomes useful financial infrastructure.

Enterprise support

S&F monetizes professional support, onboarding, analytics, monitoring, technical services, and implementation work around a protocol it does not control.

WHO BUILDS AROUND IT

A public-good protocol creates opportunities for more than venues.

Stipflip separates settlement from execution. Market makers, liquidity providers, venues, wallets, data providers, and builders can specialize around the same public settlement layer.

Public-good settlement protocol

No operator · No admin keys · No counterparty risk

Market makers

Arbitrage and liquidity

Quote markets, manage inventory, arbitrage prices, and capture spreads around oracle-reported prices.

Liquidity providers

Funding and fees

Deploy collateral into protocol pools, choose activation rates, and earn funding and fees for underwriting transparent exposure.

Trading venues

New client onboarding

Offer perpetual contracts with margin underneath.

Wallets and fintech apps

Embedded exposure

Add wallet-held exposure products where users keep positions as transferable tokens.

Oracle/data providers

Price rewards

Stake into contracts to receive settlement.

Product builders

New financial products

Build automated markets, aggregators, structured products, dashboards, routing systems, and custom execution

MICA / MIFID GAIN

Stipflip removes the operator risks that make perpetual markets hard to supervise.

MiCA and MiFID are difficult for perpetual markets because the usual model combines many risk-heavy functions in one venue: custody, execution, pricing, liquidation, counterparty exposure, admin control, and settlement. Stipflip changes that market structure. Settlement is defined by code, collateral, and oracle rounds, not by a company balance sheet or discretionary intermediary.

Custody

Users hold wallet position tokens instead of venue account balances

Counterparty

Exposure is fully collateralized instead of promised by an operator balance sheet

Control

No admin keys or privileged venue can become the hidden market controller

Settlement

Value is settled by code, collateral, and oracle rounds instead of discretionary venue logic

CURRENT FOUNDATION

S&F has already created the public protocol it is applying to grow.

Public good

Stipflip is permissionless infrastructure created by S&F but not controlled by S&F

Protocol

Collateral, issuance, redemption, oracle rounds, funding, and settlement are public protocol rules

Product

The app surface already exposes wallet, swap, earn, oracle, and market flows

Company layer

S&F provides onboarding, consultancy, implementation, compliance documentation, tooling, analytics, and ecosystem support

USE OF FIT 4 START

**Turn an operatorless
perpetual protocol into
European financial
infrastructure.**

0-3 months

Luxembourg setup, MiCA/MiFID legal memo, protocol risk mapping, onboarding materials

3-6 months

First company onboarding, operator tooling, market-maker sandbox, monitoring, analytics

6-12 months

Production support, reference markets, compliance documentation, ecosystem partnerships
